CO₂ LIGHT A/S

Environmental statement CO2LIGHT

Everyone is responsible for his/hers actions. We focus on this philosophy at CO2LIGHT, which means that we - as a company, are determined not only to carry out our daily business economically reasonable, but also operate in an environmentally responsible way. With the right focus and attitude, we believe that even a little bulb can make a big difference.

The most important aspects of our CSR strategy are:

- We personally check the conditions of the production workers in China.
- We are in favor of reusing and recycling. Therefore, all our packaging is without logo, so the material can be recycled. Furthermore, our luminaires are manufactured sustainable so they can be easily separated and recycled.
- We actively participate in our local environment, including the Aalborg Sustainability Festival, and furthermore participate in local business networks (NBEN + NV9220 and others)
- We also cooperate with other green companies as well as Aalborg University and UCN to create synergy in learning for students with both internship and project collaboration. This collaboration in-house helps build bridges between higher education and business operation, and contributes to learning/experience.

At CO2LIGHT, we encourage our customers and partners to find sustainable solutions. Therefore, we commit ourselves to look inwards - being critical of our own business, constantly seeking sustainable solutions which is in accordance with our values. We will be a solution-oriented, innovative LED wholesaler, other companies, can be proud of working with.

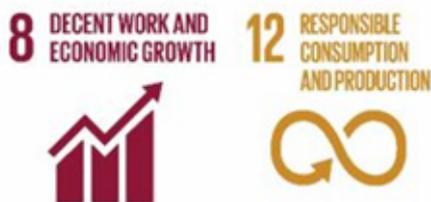

The logo for CO2LIGHT AS is displayed at the bottom of the page. It features the text 'CO2LIGHT' in a large, bold, black, sans-serif font. The '2' in 'CO2' is smaller and positioned below the 'O'. To the right of 'LIGHT' is the text 'AS' in a smaller, bold, black, sans-serif font, with the 'A' above the 'S'. The entire logo is set against a white background with a thin black horizontal line above and below it.

CO₂LIGHT AS

Future goals

As one of Denmark's leading LED and innovative houses, we, like other companies globally, want to enroll in the movement of creating a more sustainable green future. Specifically, this means that we relate to the UN's sustainability target presented in 2015, focusing on the selected points that are particularly relevant to a company such as CO2LIGHT. Below are 4 of our sustainability goals which we primarily orientate ourselves after and furthermore a description of our ambition to address these issues.

Sustainable working environment and growth

At CO2LIGHT we want to have a good working environment. Through employee development sessions (MUS) we ensure the employees sense of meaning and satisfaction at work. We strongly prioritize a constructive relationships with our suppliers in China. At least once a year, representatives of the board visits our production companies and check the employees and review the conditions in the factories, where they work. We do not want to cooperate with companies that do not comply with specific ethical guidelines, which are consistent with CO2LIGHT's. In addition, we strive to ensure continued growth in the future. We use our increased financial surplus to improve our own conditions and to recruit the most skilled colleagues for the company,

Sustainable consumption and disposal

At CO2LIGHT, we know that the primary CO2 emission comes from producing the products, so with the latest technology and know how we focus heavily on a more sustainable production. Therefore, we are committed to increasing the energy efficiency of our LED products. Innovative knowledge and green technology are effective tools. In collaboration with Aalborg University, we have engaged in a project where we test a machine that can help reduce waste from the installations our LED products replace significantly. This glass tube or "tubecrusher" will allow semi-automatic waste disposal on-site and can provide considerable environmental savings in the long term.

Sustainable cooperation and innovation

9 INDUSTRY, INNOVATION
AND INFRASTRUCTURE

12 RESPONSIBLE
CONSUMPTION
AND PRODUCTION

At CO2LIGHT, we have ambitions to be one of the most innovative in the industry and actively contribute to a greener business environment. Therefore, we continuously collaborate with Aalborg University (AAU). This collaboration is focusing on sharing knowledge across departments in order to promote overall sustainability in society. If we have to be independent from fossil fuels by 2050, it is much easier if the total energy consumption is as low as possible. This requires innovative thinking and innovative solutions. We want to be a responsible part of this conversion.

Sustainable city life and culture

9 INDUSTRY, INNOVATION
AND INFRASTRUCTURE

11 SUSTAINABLE CITIES
AND COMMUNITIES

At CO2LIGHT, we want to be part of a more sustainable local environment. Therefore, we are involved in projects such as *CloudCity* in Aalborg, which will give the citizens an even greater aesthetic experience without compromising the environment. In this context, we actively participate in local events and business networks whose main task and focus is promoting green and sustainable business transitions across industries. We also participate in the Aalborg Sustainability Festival, where we use the platform to tell ordinary citizens and guests about effective lighting and significant energy savings. Information sharing and green engagement are motivational aspects and important for our future existence and business.
